

## Problem 0: Part A (15 mins):

Playing with JSON object's Values:

Fluffy sorry, Fluffy is my fav cat, and it has 2 catFriends

Write a code to get the below details of Fluffy so that

I can take him to vet.

```
var cat = {  
  name: 'Fluffy',  
  activities: ['play', 'eat cat food'],  
  catFriends: [  
    {  
      name: 'bar',  
      activities: ['be grumpy', 'eat bread omblet'],  
      weight: 8,  
      furcolor: 'white'  
    },  
    {  
      name: 'foo',  
      activities: ['sleep', 'pre-sleep naps'],  
      weight: 3  
    }  
  ]  
}  
console.log(cat);
```

## Basic Tasks to play with JSON.

1. *Add height and weight to Fluffy.*

Answer: cat.height=10;

cat.weight=50

2. *Fluffy name is spelled wrongly. Update it to Fluffy*

Answer: cat.name=" Fluffy"

3.*List all the activities of Fluffy's catFriends.*

Answer: var fluffyFriends = cat.catFriends

```
for(var i=0; i<fluffyFriends.length;i++) {  
    console.log(fluffyFriends[i].activities)  
}
```

4.*Print the catFriends names.*

Answer: var fluffyFriends = cat.catFriends

```
for(var i=0; i<fluffyFriends.length;i++) {  
    console.log(fluffyFriends[i].name)  
}
```

5.*Print the total weight of catFriends*

Answer: var fluffyFriends = cat.catFriends

var tot\_weight = 0

```
for(var i=0; i<fluffyFriends.length;i++) {  
    tot_weight += fluffyFriends[i].weight  
}
```

console.log(tot\_weight)

*6. Print the total activities of all cats (op:6)*

*1. Add 2 more activities to bar & foo cats.*

Answer: `cat.catFriends[0].activities[2] = "drink milk"`

`cat.catFriends[0].activities[3] = "jump over the wall"`

`cat.catFriends[1].activities[2] = "lazy walk"`

`cat.catFriends[1].activities[3] = "eat cat food"`

*2. Update the fur color of bar.*

Answer: `cat.catFriends[0].furcolor = "grey"`

## Problem 0: Part B (15 mins):

Iterating with JSON object's Values

Above is some information about my car. As you can see, I am not the best driver.

I have caused a few accidents.

Please update this driving record so that I can feel better about my driving skills.

```
var myCar = {
  make: 'Bugatti',
  model: 'Bugatti La Voiture Noire',
  year: 2019,
  accidents: [
    {
      date: '3/15/2019',
      damage_points: '5000',
      atFaultForAccident: true
    },
    {
```

```
date: '7/4/2022',
damage_points: '2200',
atFaultForAccident: true
},
{
date: '6/22/2021',
damage_points: '7900',
atFaultForAccident: true
}
]
```

*1. Loop over the accidents array. Change atFaultForAccident from true to false.*

Answer: for(var i=0; i<myCar.accidents.length; i++) {

myCar.accidents[i].atFaultForAccident = false

}

*2. Print the dated of my accidents*

Answer: for(var i=0; i<myCar.accidents.length; i++) {

console.log(myCar.accidents[i].date)

}

**Real challenges start here.**

: bowtie:

## **Problem 1 (5 mins):**

### **Parsing an JSON object's Values:**

Write a function called “printAllValues” which returns a new Array of all the input object's values.

Input (Object):

```
var object = {name: “RajiniKanth”, age: 33, hasPets: false};
```

Output:

```
[“RajiniKanth”, 33, false]
```

### **Sample Function prototype:**

#### **Answer:**

```
var obj = {name: “RajiniKanth”, age: 33, hasPets: false};  
function printAllValues(obj) {  
  return Object.values(obj);  
}  
console.log(printAllValues(obj));
```

## Problem 2(5 mins):

Parsing an JSON object's Keys:

Write a function called “printAllKeys” which returns an newArray of all the input object's keys.

Example Input:

{name: 'RajiniKanth', age: 25, hasPets: true}

Example Output:

['name', 'age', 'hasPets']

**Sample Function proto:**

Answer:

```
function printAllKeys(obj) {  
  return Object.keys(obj);  
}  
console.log(printAllKeys(obj));
```

## Problem 3(7–9 mins):

Parsing an JSON object and convert it to a list:

Write a function called “convertObjectToList” which converts an object literal into an array of arrays.

Input (Object):

var object = {name: “ISRO”, age: 35, role: “Scientist”};

Output:

[[“name”, “ISRO”], [“age”, 35], [“role”, “Scientist”]]

## Sample Function proto:

### Answer:

```
var obj = {name: "ISRO", age: 35, role: "Scientist"};
function convertListToObject(obj) {
  return Object.entries(obj);
}
console.log(convertListToObject(obj));
```

## Problem 4(5 mins):

Parsing a list and transform the first and last elements of it:

Write a function 'transformFirstAndLast' that takes in an array, and returns an object with:

- 1) the first element of the array as the object's key, and
- 2) the last element of the array as that key's value.

Input (Array):

```
var array = ["GUVI", "I", "am", "Geek"];
```

Output:

```
var object = {
  GUVI: "Geek"
}
```

## Sample Function proto:

### Answer:

```
var arr = ["GUVI", "I", "am", "a geek"];
function transformFirstAndLast(x) {
  var newObject = x.reduce((acc, curr) =>
    (acc[arr[0]] = arr[3], acc), {});
  return (newObject);
}
console.log(transformFirstAndLast(arr));
```

## Problem 5 (7 -9 mins):

Parsing a list of lists and convert into a JSON object:

Write a function “fromListToObject” which takes in an array of arrays, and returns an object with each pair of elements in the array as a key-value pair.

Input (Array):

```
var array = [[“make”, “Ford”], [“model”, “Mustang”], [“year”, 1964]];
```

Output:

```
var object = {  
  make: “Ford”  
  model: “Mustang”,  
  year: 1964  
}
```

### Sample Function proto:

#### Answer:

```
var arr = [[“make”, “Ford”], [“model”, “Mustang”], [“year”, 1964]];  
  
function fromListToObject(x) {  
  var obj={};  
  for (var i=0; i<x.length;i++){  
    obj[x[i][0]]=x[i][1];  
  }  
  return obj;  
}  
console.log(fromListToObject(arr));
```

## Problem 6 (10 mins):

Parsing a list of lists and convert into a JSON object:

Write a function called “transformGeekData” that transforms some set of data from one format to another.

Input (Array):

```
var array = [[[“firstName”, “Vasanth”], [“lastName”, “Raja”],  
[“age”, 24], [“role”, “JSWizard”]], [[“firstName”, “Sri”,  
[“lastName”, “Devi”], [“age”, 28], [“role”, “Coder”]]];
```

Output:

```
[  
{firstName: “Vasanth”, lastName: “Raja”, age: 24, role:  
“JSWizard”},  
{firstName: “Sri”, lastName: “Devi”, age: 28, role: “Coder”}  
]
```

### Sample Function proto:

#### Answer:

```
var arr= [[["firstName", "Vasanth"], ["lastName", "Raja"],  
["age", 24], ["role", "JSWizard"]], [{"firstName", "Sri"},  
["lastName", "Devi"], ["age", 28], ["role", "Coder"]]];

function transformGeekData (arr) {  
var box = [];  
for(let i=0; i<x.length; i++)  
{  
var obj = {} ;  
for(let j=0;j<x[i].length; j++){  
obj[x[i][j][0]]=x[i][j][1];  
}  
box.push(obj);  
}  
return (box);
```

```
}  
console.log(transformGeekData(arr));
```

## Problem 7 (10 — 20 mins):

Parsing two JSON objects and Compare:

Read this : [https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global\\_Objects/JSON/stringify](https://developer.mozilla.org/en-US/docs/Web/JavaScript/Reference/Global_Objects/JSON/stringify)

Write an “assertObjectsEqual” function from scratch.

Assume that the objects in question contain only scalar values (i.e., simple values like strings or numbers).

It is OK to use JSON.stringify().

Note: The examples below represent different use cases for the same test. In practice, you should never have multiple tests with the same name.

Success Case:

Input:

```
var expected = {foo: 5, bar: 6};
```

```
var actual = {foo: 5, bar: 6}
```

```
assertObjectsEqual(actual, expected, 'detects that two objects  
are equal');
```

Output:

Passed

Failure Case:

```
Input:var expected = {foo: 6, bar: 5};
```

```
var actual = {foo: 5, bar: 6}
```

```
assertObjectsEqual(actual, expected, 'detects that two objects
```

are equal');

Output:

FAILED [my test] Expected {"foo":6,"bar":5}, but got {"foo":5,"bar":6}

### Answer:

```
var expected = {foo: 5, bar: 6};
var actual = {foo: 5, bar: 6};

function assertObjectsEqual(actual, expected, testName) {
  if(JSON.stringify(actual) === JSON.stringify(expected)) {
    console.log("Passed
    "+testName, "Expected"+JSON.stringify(actual), "and got" +
    JSON.stringify(expected))
  }else{console.log("Failed
    "+testName, "Expected"+JSON.stringify(actual), "but got" +
    JSON.stringify(expected))
  }}
assertObjectsEqual(actual , expected, "Comparison");
```

## Problem 8(10 mins):

Parsing JSON objects and Compare:

I have a mock data of security Questions and Answers. You function should take the object and a pair of strings and should return if the quest is present and if its valid answer.

### Answer:

```
var securityQuestions = [
  {
    question: "What was your first pet's name?",
    expectedAnswer: "FlufferNutter"
  },
  {
    question: "What was the model year of your first car?",
    expectedAnswer: "1985"
  },
  {
    question: "What city were you born in?",
    expectedAnswer: "NYC"
```

```

    }
  ]
  function chksecurityQuestions(securityQuestions,question,ans) {
  for(var i in securityQuestions){
  if (question == securityQuestions[i].question ){
  if(ans == securityQuestions[i].expectedAnswer){
  return true;
  }
  }
  else {
  return false;
  }
  }
  }

//Test case1:
var ques = 'What was your first pet's name?';
var ans = 'FlufferNutter';
var status = chksecurityQuestions(securityQuestions, ques, ans);
console.log(status); // true

//Test case2:
var ques = 'What was your first pet's name?';
var ans = 'DufferNutter';
var status = chksecurityQuestions(securityQuestions, ques, ans);
console.log(status); //false

```

## Problem 9(20 mins):

### Parsing JSON objects and Compare:

Write a function to return the list of characters below 20 ages.

#### Answer:

```

var students = [
  {
    name: "Siddharth Abhimanyu", age: 21}, { name: "Malar", age:
25},
  {name: "Maari",age: 18},{name: "Bhallala Deva",age: 17},
  {name: "Baahubali",age: 16},{name: "AAK chandran",age: 23},
{name:"Gabbar Singh",age: 33},{name: "Mogambo",age: 53},
  {name: "Munnabhai",age: 40},{name: "Sher Khan",age: 20},
  {name: "Chulbul Pandey",age: 19},{name: "Anthony",age: 28},
  {name: "Devdas",age: 56}
];

function returnMinors(x){
var agebelow20 = x.filter(function (y)
{

```

```
return y.age <20;
});
console.log(agebelow20);
}
returnMinors(students);
```
